Revision History

Date	Version	Description	Author
25/Feb/26	1.0	Initial Design + Diagrams for Web (D1–D4)	Mustafa Al-Bayati
25/Feb/26	1.1	Initial Design + Diagrams for Mobile (D5–D7)	Daniel Jönsson
15/Mar/26	1.2	Updated D3 – D4 Add Mobile App Pictures (D5 – D6)	Mustafa Al-Bayati & Daniel Jönsson
21/Apr/26	1.3	Add Table of Contents, Refactor	Daniel Jönsson
8/May/26	1.4	Add Web Accessibility Themes and Interactive Piano Visualization Design item 15, 16, 17, 18 (D4.1-D4.2)	Patrick Nordahl

Design Item List

Requirement Name	Priority
D1. Web Welcome Screen	Desirable
D2. Web User Authentication (Login/Signup)	Essential
D3. Web Device Management Interface	Essential
D4. Web Hub Control Panel + Music + Accessibility	Essential
D5. Mobile Login/Signup	Essential
D6. Mobile Control Devices in Device Hub	Essential
D7. Mobile Database Connection	Essential

Design Item Descriptions

1. Web (Next.js + React)

D1. Web Welcome Screen

Description

First screen of the web application showing Interactive House branding and entry options.

Components

App logo + title + short tagline

Get Started button

Explore as Guest link (limited access)

Design

Get Started routes the user to Login/Signup.

Guest mode allows viewing pages (e.g., Devices list read-only) but blocks actions like toggling actuators and database write actions.

Design Item 1: Use Case Diagram, Welcome Page

Design Item 2: Sequence Diagram, Welcome Page Navigation

Design Item 3: Class Diagram, Welcome Page Structure (UI + Navigation)

Design Item 4: State Diagram, Welcome page

D2. Web User Authentication (Login/Signup)

Description

Secure login and signup for registered users to access full system features.

Components

Email & Password Authentication

Sign In button

Signup link

Design

Users must authenticate before performing any control actions.

Passwords are never stored in plain text; only password hashes.

After successful login: redirect to Devices or Hub screen.

Security constraints:

- Minimum password length (e.g., 8)

- Basic rate limiting on login attempts (server-side)

Design Item 5: Login/Signup, Use Case Diagram

Design Item 6: Login, Sequence Diagram

Design Item 7: Signup, Sequence Diagram

Design Item 8: Login/Signup, Class Diagram

Design Item 9: Login Page, State Diagram

Design Item 10: Signup Page, State Diagram

D3. Web Device Management Interface

Description

The Web Device Management Interface provides a centralized overview of all connected smart home devices and sensors. It allows users to view device status, hardware pin assignments, and connectivity state through a structured card based interface. The page acts as a device inventory and monitoring interface and complements the Hub control panel where actual control actions are performed.

Components

Device cards grid layout

Each device card contains:

- Device icon
- Device name (e.g., White Light, Fan INA, Door)
- Hardware pin reference (e.g., Pin 13, Pin 9)
- Current device state (ON/OFF, OPEN/CLOSED)

Navigation components:

- Top navigation header
- Links to Hub, AI, Music and Database

Design

Device data is retrieved dynamically from Firebase Firestore. The interface uses a card-based layout with dark theme styling, consistent with the mobile UI design. Each device card displays real-time information using Firebase snapshot listeners. The page functions as a monitoring interface, while device control actions are primarily executed through the Hub Control Panel. Guest mode allows users to view devices but disables any interaction with actuator controls.

D4. Web Hub Control Panel

Description

The Web Hub Control Panel serves as the main dashboard for interacting with smart home hardware devices.

It provides real time control of actuators and monitoring of sensor telemetry through a unified interface.

The hub aggregates device state information from the Firebase cloud database and allows authenticated users to update device states.

Components

Actuator control section:

- White Light toggle switch
- Orange Light toggle switch
- Fan INA control toggle
- Fan INB control toggle
- Door servo control (open/close)
- Window servo control (open/close)

Sensor monitoring section:

- Motion sensor status indicator
- Steam sensor raw value display
- Gas sensor raw value and alert indicator

System synchronization section:

- Arduino synchronization status
- Last source of update
- Last updated timestamp

User interface elements:

- Toggle buttons for device control
- Real time sensor value display
- Visual alerts for abnormal sensor states

Design

The Hub Control Panel is connected to **Firebase Firestore** using real time listeners (onSnapshot).

Device states are synchronized instantly between the web dashboard and the hardware system.

When a user interacts with a control toggle, the application sends an update request to Firestore using `updateDoc()`. The Arduino system reads these updates and performs the corresponding hardware actions. The UI automatically updates whenever device or sensor values change, ensuring that the dashboard always reflects the current hardware state. The design ensures real-time communication between the web interface, cloud database, and hardware layer. Access control rules are that only authenticated users can control actuators. Guest users can view sensor data but cannot modify device states.

Design Item 11: Use Case Diagram, Hub Page

Design Item 12: Class Diagram, Hub Page (components + state + logic)

Design Item 13: Sequence diagram for the Hub page

Design Item 14: Hub Page, State Diagram

D4.1 Web Accessibility Themes

The web interface includes accessibility-focused color themes designed to support users with different types of color vision deficiencies.

The available themes are:

- Default
- Protanopia
- Deuteranopia
- Tritanopia

The theme system dynamically updates the visual appearance of the dashboard while preserving the existing component structure and functionality. The design aims to improve readability and user accessibility while maintaining a consistent smart-home interface. The choice of theme is also stored in the browser cookies and is saved even if the user exits the browser and opens it again at a later time.

Design Item 15: Web Accessibility Theme – Protanopia

Design Item 16: Web Accessibility Theme – Deuteranopia

Design Item 17: Web Accessibility Theme: Tritanopia

D4.2 Web Music Interface

Description

The Web Music Interface includes playback controls and an interactive piano visualization synchronized with the currently played melody.

Components

- Music track list
- Playback controls
- Playback speed selector
- Interactive piano visualization

Design

The interface visualizes currently played notes using an animated mini piano component synchronized with the active melody frequency data. Piano keys dynamically highlight while notes are played, giving the user visual feedback of the melody progression in real time.

Design Item 18: Web Music Interface Preview.

2. Mobile (Expo + React Native)

D5. Mobile Login/Signup

The login/signup module serves as the primary security gateway for the Interactive House Mobile application. This design item manages the transition from an unauthenticated Welcome Screen state to a fully authorized session. The Use Case diagram illustrates the top-down functional flow, showing how the Welcome Screen extends into Signup and Login actions, ultimately triggering the Navigate to Home use case upon token storage.

The Class diagram specifies the structure of the authentication system, highlighting the data attributes (email, password, name) and core methods (handleLogin(), handleSignup()) that facilitate communication between the UI and the storage utilities.

The Sequence diagram details the chronological communication between the User, API, and SecureStore, specifically showing the logic gate where the system checks for credentials before firing a network request.

The State diagram models the application's behavior at a high level, defining the transitions between LoggedOut and LoggedIn status and the internal logic used to handle "App Start" and session timeouts.

Design Item 19: Use Case Diagram

Design Item 20: Class Diagram

Design Item 21: Interaction Sequence Diagram

Design Item 24: Mobile App Preview – Login Screen

D6 - Mobile Control Devices in Device Hub

The Device Hub is the core operational component of the mobile, responsible for the real-time control and monitoring of hardware actuators and sensors. The design implements a React Native component hierarchy that translates raw hardware configuration (devices-config.json) into an interactive UI element. This will later be migrated directly through the database connection. However, Json might be good to keep, for mockup data and offline persistence.

Design Item 25: Use Case Diagram

Design Item 26: Class Diagram

Design Item 27: Interaction Sequence Diagram

Design Item 28: State Diagram

Design Item 29: Mobile App Preview of Device Hub

D7 – Mobile Database Connection

The Database Connection design item ensures data persistence and real-time state synchronization between the mobile client and the smart home hardware. This module bridges the local UI with the cloud backend through a high-performance hybrid architecture.
